FIRST IN 1895

GREENWICH OBSERVATORY INSTALLED
SYNCHRONOME FREE PENDULUMS
IN THE YEAR 1925

FOREMOST EVER SINCE

THE Synchronome System is the product of a long series of inventions which began in 1895 by Mr. Hope-Jones, who enunciated and developed the principles upon which the science and practice of Electric Time Service have been established.

There are systems offering to-day which are unprincipled. To apply this epithet to an individual would be to say the worst of him; yet what is true in the case of an individual is also true of electric clocks.

PRINCIPLES In a life-long effort to obtain reliable contacts from a clock, without detriment to its time-keeping, a group of fundamental laws have been established which are known to Horology as the Synchronome Principles. An unwavering adherence to these principles has carried the system right up to the top in Commerce and in Science; in Commerce by many thousands of installations giving uniform and accurate time; in Science by the Free Pendulum, which has broken all records for accuracy and in measuring time in Observatories all over the world. It was installed at Greenwich Observatory in the year 1925 and the records then set up remain unbroken to this day by any pendulum clock.

It was our privilege to originate the Wireless Six Dot Seconds and to devise the instruments which transmitted them.

CONTROLLING PENDULUM

The Master Clock, or Controlling Pendulum, is, of course, the first essential of the System. Its extraordinary accuracy is due to the detached gravity escapement, constant in force and always applied to the pendulum at the centre of its path. The pendulum has very little work to do and that little is done when it is passing through the middle of its swing; otherwise it is altogether FREE. It is not called upon to make the electrical contact which propels the subsidiary clocks.

The pendulum rod is of Invar and is simply, but fully, compensated for fluctuations in temperature.

Variation of battery power cannot affect the time-keeping of the clock, neither the measurement of time by the pendulum, nor the synchronous propulsion of the dials.

THE SYNCHRONOME SWITCH

The switch consists of two pivoted levers shown in black in our illustration, namely, the gravity arm and the armature.

THE CONTACT The gravity arm sails into contact with the armature at the speed of the moving pendulum, quickly enough to prevent preliminary sparking, but not quickly enough to cause a bounce. The first effect of the passage of current is to draw the armature into harder contact in the act of lifting the gravity arm.

The two moving members of the switch travel together until the armature comes up with a rush against the poles of the magnet and the gravity arm flies off by its momentum; thus each half-minute contact is perfectly clean and precise in the make and break.

All the energy derived from the electro-magnet in the first place and ultimately expended in swinging the pendulum is mechanically transmitted through the surfaces of the contact.

Here is a photograph of the electrical impulse which passes through all the dials every half-minute.

UNIFORMITY OF ALL DIALS ASSURED

Observe the clean "make" and precipitous "break".

When the current has risen to .25 amp.—and it takes .06 of a second to reach it—all the dials operate and the little dent or depression shows they have done so. Not until the current has risen to a higher figure is the switch automatically thrown open. Thus the switch is bound to transmit sufficient electrical energy to operate every dial; it cannot work at all without doing so, because the duration of the contact is dependent upon the dials' self-induction which is the electrical equivalent of Inertia. The Inertia of a body is the measure of the power required to move it. Each dial asks for and gets exactly the current it needs.

This vital principle, unknown until the Synchronome invention was launched in 1895, remains the essential feature in *our* system and the best practice in modern electric time service is based upon it.

BATTERY WARNING

Thereon depends the unique compensatory action by which the duration of the contact is increased with failing current. This condition of affairs is known as Battery Warning, which is quite automatic.

The consumption of current is negligible—so small in fact that it has no effect on the life of the battery—but a time will come when the magnet will be unable to throw up the gravity lever. When this happens, the pendulum, on its return to the left, will assist it and the increased duration of the contact which results in immediately noticeable on all the clocks, yet the installation will continue to work perfectly for some days in this battery-warning condition.

If this attention-compelling battery warning is neglected and the pendulum allowed to stop, the battery is **automatically** disconnected.

NEGLIGIBLE CURRENT CONSUMPTION

The area embraced by the oscillograph curve on page 2 is the measure of the current consumed; it means that one B.O.T. unit will run a circuit of 25 clocks for ten years. **This effectively disposes of the impression that battery-driven clocks are costly to operate.**

SOURCE OF CURRENT

Any source of electrical energy can be used, but if alternating, a rectifier is necessary. Small storage cells are recommended for large time circuits; but dry cells of good quality can be used with equal satisfaction, and they require no attention whatever beyond renewal at the end of their useful life. We do not advocate the direct use of electric supply mains unless the service is absolutely continuous and free from interruption.

WIRING DETAILS The wiring consists merely of the connection of each dial with its nearest neighbour in simple series circuit, preferably carried out by a single line of 3·029" gauge, 600 megohm grade cable. In large buildings, where a considerable number of dials are to be installed, it is advisable to arrange the wiring in two or more loops in order to obviate the risk of complete stoppage should any disconnection occur.

Special circuit arrangements have been evolved by us whereby any number of dials can be grouped together to form series-parallel loops, so that in the event of a disconnection occurring on any one loop, only the clocks connected thereto will stop, the remainder of the installation continuing to work uninterruptedly. The operation of one of the loops in series with the Master Clock movement ensures that no sacrifice is made of the compensatory action by which the duration of contact automatically lengthens with failing current. Should the disconnection occur on the loop to which the Master Clock is connected, special provision is made to ensure that this instrument automatically continues to operate.

In installations of this nature the wiring is terminated in a special Distribution Board (a typical example of which is illustrated below) usually fitted closely adjacent to the Master Clock.

This method is the best but not necessarily the least expensive of the methods available. Time circuits of prime responsibility in important buildings and offices—such as the Headquarters of the British Broadcasting Corporation, Langham Place, W., the great Unilever Building, and also Electra House on the Embankment and the new Headquarters of the Railway Executive, London Midland Region, Euston, etc., — all have their Synchronome installations operated in series-parallel loops from a distribution board as illustrated above.

The Synchronome System of uniform and accurate time has been found to be of inestimable advantage in—

OFFICES INSTITUTIONS RAILWAY STATIONS LIBRARIES
WORKS HOSPITALS SPORTS PAVILIONS THEATRES
MILLS SCHOOLS GARAGES PETROL-FILLING STATIONS

as may be judged from a glance at our list of Installations containing names which are household words.

THE CONTROLLING PENDULUM

OR MASTER CLOCK

(STANDARD TYPE)

This is a combination of a pendulum and a switch and will operate any number of subsidiary clocks of any size including Turret Clocks, thus ensuring uniform and accurate time throughout the premises without winding or other attention.

The pendulum is a rod of INVAR, a nickel steel alloy having a negligible temperature coefficient.

It has a free detached gravity escapement with impulse at zero, the time counting and releasing of the gravity lever being performed by a jewelled mechanical action.

Overall dimensions of case — 50 inches long, 11 inches wide, 6 inches deep. Supplied with 7 inches diameter silvered dial in polished hardwood case.

THE **CONTROLLING PENDULUM** OR **MASTER CLOCK** (WITH SECONDS CONTACT)

This instrument shown with its door open is similar to that on the previous page but is provided with means of transmitting impulses at intervals of one second in addition to impulses every thirty seconds.

The seconds contact is produced by a subsidiary Synchronome Switch—released by a jewelled steel toggle on the pendulum. Its duration is determined by the self-induction of the circuit, and a powerful switching action is obtained without any interference with the high standard of timekeeping of the pendulum.

Useful for many scientific and industrial purposes where seconds impulses are required. Its time-spacing is accurate to one-thousandth part of a second. Dial diameter 7 inches. Supplied with seconds hand traversing the full scale of the dial, and small inset dial with hour minute hand hands, or with hour and minute hands traversing full scale of dial and inset seconds dial.

.....

SYNCHRONOME **MAINPULSE** **CLOCKS**

WHERE Alternating Current supply mains with time-controlled 50-cycle frequency are available and the number of clocks required is small, it may be felt that the expense of a master clock is unwarranted. In such cases we recommend the installation of **SYNCHRONOME MAINPULSE A.C. Clocks**, which, as their name implies, are Synchronome Clocks designed to operate directly from the mains.

They are made in two voltage ranges for operation on either 100-125 volts or 200-250 volts, and have behind them over forty years' experience in the manufacture of electric clocks.

A very wide range of designs is now available, which includes:—

Timepiece models for wall use

Turret Clocks of all sizes, with or without
striking and chiming mechanism

Automatic Programme Controllers

IN OFFICE, WORKS AND HOME

SYNCHRONOME IMPULSE OR MAINPULSE

TERMS AND CONDITIONS OF SALE

This List cancels all previous issues and is subject to alteration without notice.

The Illustrations appearing in this list show the general appearance of the various items, but as improvements and alterations in design may be made from time to time, they are not binding. Packing and Cases are charged for, but are credited in full when returned carriage paid to our Works: Abbey Electric Clock Works, Mount Pleasant, Alperton, Middlesex.

Carriage is charged to the customer.

Ordering. The List Number should be clearly stated, and where alternative finishes are mentioned the finish required must be specified, otherwise we reserve the right to supply at our discretion.

Guarantee. All instruments are guaranteed by us against defects in workmanship and material for a period of twelve months from date of despatch from our Works.

This guarantee is subject to the instruments having been erected and operated in accordance with our instructions.

In all cases our liability shall be limited to the making good of any faulty workmanship or materials, or the replacement at our discretion of any faulty part or parts.

*The products of
The Synchronome Co., Ltd.
are British throughout.*

SURFACE MOUNTING DIALS

TYPES "A" & "B"

The "A" type is fitted with matt-white or cream dial, bronzed spun bezel and sheet glass, mounted in Oak or Mahogany frame, stained and polished to any desired shade. The "B" type is fitted with hand-engraved and silvered brass dial, cast bezel and bevelled plate glass, mounted in mahogany, walnut or oak frame, which can be polished to any desired shade.

Either "A" or "B" types can be supplied with Roman or Arabic figures.

Dial size Inches	Overall size Inches	Projection Inches	
		"A" Type	"B" Type
8	10·6	2·4	2·5
10	13·0	2·4	2·5
12	15·2	2·4	2·5
18	22·2	2·8	3·0
24	28·5	3·2	3·5

INSERTION PATTERN OR FLUSH FITTING DIALS

TYPES "A/I" & "B/I"

The "A/I" type is fitted with matt-white or cream dial with Roman or Arabic figures.

The "B/I" type is fitted with hand-engraved and silvered brass dial with Roman or Arabic figures.

Both types have heavy cast bezels with bevelled plate glass. The bezel conceals a metal fixing ring having slotted screw holes for levelling the dial when erecting. The bezel is attached to the ring by metal thread screws, thus facilitating the removal of the clock for inspection.

Dial Size Inches	Overall Size Inches	Projec- tion Inches
6	6.6	0.71
8	8.5	0.83
10	11.0	0.87
12	12.7	0.9
18	19.4	1.1
24	25.5	1.57

TYPE "BBC" & "BBC/I"

Matt-white dial with black cipher marks, chromium-plated bezel with bevelled plate glass, for either insertion or surface mounting, the latter having oak, mahogany or walnut frame.

Dial Size Inches	Overall Size		Projection Inches	
	Surface	Insertion	Surface	Insertion
8	10.6	8.5	2.5	0.83

12	15.2	12.7	2.5	0.9
18	22.2	19.4	2.8	1.1

TYPE

"C"

(WORKSHOP PATTERN)

The frame and dial consist of a single sheet steel stamping, high temperature vitreous enamelled, the hands protected by glass.

Specially designed for use in workshops, etc., where the atmosphere is dust- or fume-laden.

Dial Size Inches	Overall Size Inches	Projection Inches
12	16.8	2.5
18	23.0	3.3

HERMETICALLY SEALED CAST-METAL DIALS

TYPE "CM"

Specially designed for operation in exposed positions and for interior use in damp or fume-laden atmospheres.

The sketch on the right shows a section of dial mounted on the surface of a wall.

Cast-metal case with white enamelled cast-metal dial, having raised black hour chapters and minute divisions, hands protected by glass, movement housed in a cast-metal box. Substantial terminals are provided in a separate compartment arranged in the form of a fixing lug at the 12 o'clock position, and the connections between the terminals and the movement are carried in heavy flexible metallic tubing. Thus the complete assembly is hermetically sealed, water- and air-tight, fume, dust and steam proof.

8" dial, 11" overall, 2½" projection.

*Can be supplied with spray coloured
case to sample at extra cost*

INSERTION PATTERN OR FLUSH FITTING DIALS

TYPE "G/I"

The "G/I" type is fitted with heavy brass dial of Tompion design with Roman numerals hand-engraved on a silvered ring, raised upon a matt-gold ground. It has a heavy cast bezel with bevelled plate glass. The bezel conceals a metal fixing ring, having slotted screw holes for levelling the dial when erecting. The bezel is attached to the ring by metal thread screws, thus facilitating the removal of the clock for inspection.

Dial Size Inches	Overall Size Inches	Projection Inches

TURRET CLOCKS

CAST SKELETON IRON DIALS

TYPE TE

Finished black and gilt as illustrated, or to approved colour. Panelled with white opal glass and suitable for shadowless illumination. Movement totally enclosed in metal box. Balanced duralumin hands finished black or to approved colour.

Type "TE" dials are fitted with our Patent Detachable Centres, by means of which the whole centre portion of the dial with movement and hands attached can be withdrawn into the building, thus providing ideal access to the exterior of the dial for cleaning, repainting or regilding and obviating the necessity for expensive scaffolding, ladders, etc. Full details as to the construction of openings required supplied on application.

PUBLIC BRACKET CLOCKS

No finer medium is available for focusing attention on business premises than a Public Clock which can be relied upon. A clock which is both dignified and attention-compelling affords publicity of the right kind for twenty-four hours per day.

Clocks with any desired diameter of dial can be supplied and the small movement fitted behind the bosses of the hands ensures perfect internal illumination without shadow.

Designs and estimates will be submitted without obligation on receipt of a photograph or rough sketch of the elevation of the premises.

The Synchronome Programme Controller

For operating Electric Bells, Hooters, Syrens and all other forms of Warning Signals, to a predetermined programme in exact synchronisation with the clocks in the premises, an Automatic Bell Controller forms a valuable addition to the SYNCHRONOME system in Schools, Factories, Business Establishments, etc.

This instrument may be included anywhere in a circuit of electrical impulse dials, to control an independent circuit comprising any number of electric bells or other sound-producing devices.

A variety of programmes can be performed according to the type of instrument selected. The standard range of instruments operate to five minutes selectivity and will operate up to 4 separate bell or hooter circuits or provide 4 day to day changes of programme.

Each instrument has built in Duration Reducer limiting the sounding of the Bells or Hooters to approximately 10-12 seconds as experience proves sounding for 30 seconds to be too long. Automatic Week-end Silencer is also provided and mercury tube contact to carry 5 amps. at 230-250 volts is a standard fitment.
